FOOD CYCLE

OBJECT-ORIENTED PROGRAMMING PROJECT

SPRING 2026

ABSTRACT

Food waste is a global challenge; approximately one-third of produced food is wasted annually. In sectors like hospitality, high-quality surplus food is often discarded, contributing to environmental pollution while many families face food insecurity.

FoodCycle addresses this problem by providing a digital platform developed with C# and OOP principles. The system acts as a real-time bridge between food providers and charitable organizations. Through a centralized administrative dashboard, the software manages the listing, verification, and requesting of donations.

The implementation of FoodCycle aims to significantly reduce local food waste and lower the carbon footprint associated with organic waste. By digitizing surplus food management, the project ensures that resources reach the underprivileged efficiently. Ultimately, FoodCycle fosters a sustainable, data-driven approach to social welfare, demonstrating how software solutions can effectively solve real-world logistical and environmental challenges.
